

Private data to executive PowerPoint

Low-code business case for enterprise adoption

Copilot Studio connects privately to Azure Databricks through API Management, then creates a governed PowerPoint deck for business users.

ILLUSTRATIVE BUSINESS CASE

100

active business users

\$74K

net monthly capacity value

2.4 months

estimated payback

Business-unit case: \$893K annual run-rate benefit

Illustrative scenario for 100 active users across business functions

MONTHLY CAPACITY VALUE

\$84.4K

1,125 productive hours released

MONTHLY OPERATING COST

\$10.0K

Platform and operating estimate

NET MONTHLY BENEFIT

\$74.4K

Capacity value less recurring cost

ANNUAL RUN-RATE BENEFIT

\$892.5K

Before one-time implementation cost

INVESTMENT RESULT

The model reaches payback in 2.4 months and produces \$717.5K of net benefit in year one after the \$175K implementation estimate.

Year-one ROI

243%

Net benefit divided by total year-one cost

Financial value represents productive capacity that teams can redirect to selling, customer planning, operations, and decision support. It does not assume a payroll reduction.

Base formula

100 users × 5 decks per month × 3 hours saved × \$75 per hour × 75% productive usage

Each completed deck releases about three hours of employee capacity

The largest savings come from data preparation, chart creation, and revision cycles

WHAT CHANGES

Data preparation

Agent calls governed APIs instead of manual exports

Analysis

Genie translates business questions into governed queries

Presentation

The deck skill creates native slides and charts

Review

Users validate insights and refine the narrative

60% less employee time per deck

Low-code access keeps Databricks private

A managed connector and APIM gateway provide a governed path from business users to private data

One reusable low-code pattern can serve many business functions

Teams use the same governed connector and deck skill while changing prompts, data permissions, and presentation templates

Sales

Pipeline reviews

Account plans and forecast decks

Supply chain

Inventory and demand

Supplier and fulfillment reviews

Finance

Performance analysis

Budget and variance decks

Operations

Service and quality

Weekly operating reviews

Product

Portfolio performance

Launch and adoption updates

Leadership

Cross-functional metrics

Executive and board briefings

Low-code delivery expands the addressable audience because business teams can reuse approved tools without building separate integration services.

Five assumptions determine most of the financial value

The model is editable and should be recalibrated with pilot usage and time-study data

Assumption	Pilot	Business unit	Enterprise
Active users	25	100	300
Decks per user per month	4	5	5
Hours saved per deck	2.5	3.0	3.5
Loaded labor cost	\$75/hour	\$75/hour	\$75/hour
Productive usage factor	70%	75%	80%
Monthly operating cost	\$5,000	\$10,000	\$25,000
One-time implementation	\$60,000	\$175,000	\$350,000

CORE FORMULA

**Users × deck volume ×
hours saved × loaded hourly
cost × productive usage**

INTERPRETATION

Capacity value measures time redirected to higher-value work. Convert it to hard-dollar savings only when staffing, contractor, or outsourcing costs actually decline.

\$98K pilot benefit scales to a \$3.48M enterprise run rate

Net benefit equals released capacity value less estimated monthly operating cost

SCENARIO RESULTS

Pilot

\$8.1K / month

7.4 month payback

Business unit

\$74.4K / month

2.4 month payback

Enterprise

\$290.0K / month

1.2 month payback

Annual figures exclude one-time implementation cost. Year-one ROI includes implementation and twelve months of operating cost.

Business-unit case: \$717.5K first-year net benefit

The \$175K implementation estimate is recovered during the third month of production use

MONTHLY RUN RATE

Gross capacity value

\$84.4K

Recurring operating cost

(\$10.0K)

Net monthly benefit

\$74.4K

Payback

2.4 months

\$175K ÷ \$74.4K

YEAR ONE

Gross capacity value

\$1.013M

Recurring cost

\$120K

Implementation

\$175K

Net benefit

\$717.5K

Year-one ROI = \$717.5K net benefit ÷ \$295K total year-one cost = 243%

Annual run-rate after year one: \$892.5K, assuming stable usage and operating cost

A \$175K implementation and \$10K monthly run rate support the business-unit case

Planning estimates cover the private connectivity, low-code agent, governance, and ongoing operations

One-time workstream	Estimate
Network and security foundation	\$45K
APIM APIs, policies, and connector	\$40K
Copilot agent and deck skill	\$45K
Testing, enablement, and governance	\$45K
Total	\$175K

Monthly operating category	Estimate
Copilot Studio capacity	\$2K
APIM, networking, and monitoring	\$2K
Incremental Databricks compute	\$4K
Operations and improvement	\$2K
Total	\$10K

These are budget placeholders, not vendor quotes. Reuse of an existing APIM service, Databricks estate, networking, or operations team can materially reduce the incremental cost.

A 12-week rollout moves from one use case to a governed enterprise service

The first pilot should prove time savings, data accuracy, security, and unit economics before broader adoption

Scale only after the pilot meets the agreed thresholds for hours saved, data quality, security, and cost per completed deck.

A 25-user pilot can validate the model before enterprise investment

A focused pilot of less than one recurring executive deck with real usage, security, and cost telemetry

PILOT AUDIENCE

25 users

Across two or three business functions

MONTHLY DECK VOLUME

70 decks

4 decks per user at 70% usage

CAPACITY RELEASED

175 hours

2.5 hours saved per completed deck

NET MONTHLY VALUE

\$8.1K

\$13.1K value less \$5K run rate

SCALE CRITERIA

Time saved	At least 2.5 hours per completed deck
Adoption	At least 60% of pilot users active each month
Quality	Business owner accepts the data and narrative
Security	No public data path and no high-severity findings
Unit cost	Platform cost at or below \$75 per completed deck

Pilot investment

\$60K

Recommended decision

Fund the pilot, measure actual time saved and consumption, then use the same model to approve business-unit scale.

Illustrative pilot economics: \$97.5K annual run-rate benefit and 7.4-month payback
